

SP8602 Caravan Door Retainer Release

For caravans with snap type or magnetic retainer

Allows you to release the caravan door from the anti-slam securing device without having to lean round or step outside

The device hangs between the open, retained caravan door and the caravan side, near the outside edge of the door, on a suitably placed adhesive hook.

The bulb and tube pass through between the hinged edge of the door and the caravan wall. The ball will have to be squeezed to pass through.

Inside, the ball rests on a hook attached to the door frame

With the door in the retained position the lift bag is inflated enough to be firm between the door and the caravan side. This is the “ready” condition.

When the retained door is to be released, a few squeezes of the ball will inflate the lift bag and push the door free from the retainer.

A short press on the release valve will return the bag to the ready condition.
